

# Lighting The Scene

The most important subjects we will study to learn about Film Lighting:

- 1- Fundamentals of light and shadow: Understanding how light interacts with objects and how to use shadows to create depth and mood.
- 2- Lighting techniques: Mastering three-point lighting, soft lighting, hard lighting, and other techniques to achieve different visual styles.
- 3- Color theory: Learning how to use color temperature, gels, and other tools to create specific moods and atmospheres.
- 3- Exposure and metering: Understanding how to properly expose a shot and use light meters effectively.
- 4- Practical lighting setups: Hands-on experience working with different lighting equipment in a studio or on location.

These are some core concepts, and our film courses may offer more advanced lighting courses tailored to specific genres or creative goals.
